### **CENTER FOR AUTISM AND RELATED DISABILITIES**

## **FACT SHEET – SPECIALISTS**

### **Choosing Professionals & Coordinating Services**

Because autism and its related disabilities are difficult to diagnose, a child may be evaluated by a variety of professionals before a final diagnosis is determined.

Unless specifically trained in the area of developmental disabilities, physicians and psychologists may have little experience with autism spectrum disorders. Many have never seen a child with autism or a related disability when a parent brings a child in with the first signs of the disability emerging.

The following are brief descriptions of the specialists most commonly associated with diagnosis, intervention, and treatment of autism spectrum disorders. Also included are suggestions about how to select professionals to work with you and your child.

### **Specialists**

**Developmental Pediatrician:** A physician specializing in diagnosing and treating children with developmental disabilities from birth to adolescence.

**Psychiatrists:** A physician who focuses on diagnosing and treating mental illnesses from a biological and psychological perspective and may prescribe various medications for treatment.

**Psychologist:** A licensed practitioner specializing in understanding a person's behavior, emotions, and cognitive skills. They may recommend strategies to aid growth and development or help with challenging behaviors.

**Neurologist/Pediatric Neurologists:** A physician specializing in diagnosing and treating disorders of the nervous system.

**Geneticist:** A physician specializing in the study of disorders associated with heredity.

### **The Selection Process**

Choosing a professional is not always easy. When choosing a professional to work with you and your child, it's important to look for someone who shows respect for the parents and regards parents as experts on their children.

The professional should convey a sense of hope and have a philosophy similar to your own. Look for a professional who takes an individualized approach to treatment and intervention- one who does not say that all people with autism exhibit the same characteristics.

Based on your child's needs, it will take various professionals working together with you to develop a treatment and intervention plan. The most effective treatment of people with autism almost always involves a long-term team approach.

Visits to the classroom, home, and community usually provide the most useful information about the child. Since frequent visits may not be possible, the professional may collect information through interviews and questionnaires.

Just as professionals ask many questions, so should you. Remember, no questions you have regarding your child are trivial or unimportant. You may want to ask some of the following questions of the physicians and therapists:

- What are my child's strengths? How can they be maximized?
- What specific activities or interventions should I do at home?
- What kind of testing and evaluations should my child have?
- Why should my child have these tests and evaluations?
- How is each test or evaluation performed?
- How will the results influence my child's intervention or treatment?
- Can you put me in touch with another family you are currently working with?
- Do you have any articles or resources on autism or autism spectrum disorders?
- Can I have a copy of your report? How soon will it be until I receive it?

Obtaining and reviewing all reports is very helpful in understanding your child's needs, progress, and how recommendations can maximize your child's potential.

For a list of some of professionals in the FAU CARD region, please see our Directory of Service Providers on our website: [www.coe.fau.edu/card/](http://www.coe.fau.edu/card/)

## **Service Coordination**

Sometimes evaluations and recommendations may be different or conflicting. This can be confusing and exhausting. A case manager or service coordinator can help when questions, problems, or concerns arise.

A case manager keeps current records and, when appropriate, shares information about a child with professionals involved in that child's care. It's one very effective way to make sure a child's needs are being met.

Case managers may also help by making sure all appointments are scheduled, tests are performed, evaluations conducted, and that appropriate and effective follow-up care is being provided.

If an evaluation has been performed by the Early Steps program or if the child is receiving services through another state funded program, chances are that one person has been designated as a service coordinator or case manager.

If this is not the case, you can ask for help from your pediatrician or family physician, local Autism Society of America chapter, your local school district special education department, or CARD. Some parents elect to perform this role themselves.

## **Working Together**

Parents and professionals communicating effectively and respectfully as partners is an important factor in achieving progress and success for any person with autism or a related disability. Working as a team by sharing information and responsibility can be the most effective approach when developing a treatment plan. Parents often have the best understanding of their children's behavior, communication, preferences, and motivations. Professionals may suggest various ways to help a child, but parents know which activities are practical for their family life. Parental perspective is integral when developing an intervention plan.

Professionals, specializing in autism and related disabilities, have specific knowledge and training with regard to evaluation and development of education and treatment plans.

By working together and respecting each other as equally important partners in a child's care, parents and professionals can optimize the potential for a child's development.
