Medical Monitoring Program for Animal Users

Introduction

The National Institutes of Health (NIH) require that each university receiving federal support for research involving vertebrate animals have a Medical Monitoring Program for personnel with animal contact. Following the guidelines of the NIH and the National Research Council (NRC) publication, *Occupational Health and Safety in the Care and Use of Research Animals*, Florida Atlantic University (FAU) has developed a Medical Monitoring Program for Animal Users (MMPAU).

The purpose of the program is to prevent, monitor, and reduce diseases transmitted from animals to man (zoonotic diseases). In addition, educational programs have been established to educate personnel about zoonotic diseases, personal hygiene, and other related issues.

The program is designed to meet or exceed health and safety requirements established by the NIH/NRC, and protect individuals working with animals. Such individuals are evaluated with respect to the type, and extent of his or her animal contact, and are advised on the inherent risks involved with the animal research and the recommended medical procedures, in an effort to provide a healthy and safe work environment.

Definitions

**Animal contact**: Defined as direct physical contact with one or more animals used for research or teaching at the University.

**Decontamination**: use of physical or chemical means to remove, inactivate or destroy pathogens on a surface or item to the point where they are no longer capable of transmitting infectious particles and the item or surface is rendered safe for handling, use, or disposal.

**Personal protective equipment (PPE)**: special clothing worn by an employee to protect against a hazard. General work clothes (uniforms, pants, shirts, blouses) not intended to function as protection against a hazard are not considered to be personal protective equipment.

**Zoonotic diseases**: diseases transmitted between animals and man.

Eligibility in the MMPAU

All faculty, staff, student and visiting researchers who are working with animals owned or used by FAU are required to be enrolled in the MMPAU.
Responsibilities

Environmental Health and Safety

Environmental Health & Safety (EH&S) administers the MMPAU and establishes administering guidelines, coordinates the activities of the program, and maintains records generated by the program. Specific services provided by EH&S include, but are not limited to familiarizing FAU's departmental and laboratory contact representatives with the MMPAU, identifying eligible participants and determining the type of medical monitoring that each participant should receive, providing the necessary forms used in the MMPAU to the departments, coordinating services provided by consulting physicians to participants, and informing participants of these services. Questions concerning administration of the MMPAU should be directed to the Environmental Health and Safety Office at 297-3129.

Departmental and/or Laboratory Contact

Each department and/or laboratory will designate a contact person to coordinate between the Principal Investigators or supervisor, individual workers, and EH&S. The contact person will notify EH&S of new individuals working with animals and those who have terminated their animal contact. Each department and/or laboratory will inform EH&S of any changes in the designated contact person, his or her phone number and mailing address at FAU.

Comparative Medicine

Comparative Medicine is responsible for training in safe handling protocols for animals, providing technical support regarding medical and clinical directives, and interpretations. Questions regarding veterinary aspects of zoonotic diseases should be directed to the University Veterinarian at 297-4233. When necessary, the question will be routed to the medical services provider or to experts in the field of animal research.

Medical Services Provider (MSP)

MSPs offer professional medical support services for the MMPAU. The University has a contract with an MSP who will consult with EH&S to determine the risks associated with animal contact for each individual. The MSP will provide physical examinations, administer appropriate immunizations, and provide treatment for animal related illnesses or injuries and follow-up services when authorized by the University.

Principal Investigators or Supervisor

It is the Principal Investigator or supervisor's responsibility to ensure that all individuals working with animals are enrolled in the MMPAU. The Principal Investigator or supervisor must inform the designated contact person or EH&S of new individuals working with animals.
Identifying Participants in the MMPAU

When an individual becomes associated with a Principal Investigator or supervisor and will have direct physical contact with laboratory animal(s), the Principal Investigator or supervisor must ensure that a "Medical Monitoring Authorization Requirement" packet is completed and sent to EH&S. Once this packet is received by EH&S, the individual will be "enrolled" in the medical monitoring program.

The forms can be found on EH&S web site Department of Environmental Health and Safety. EH&S or the Principal Investigator can assist the individual working with animals in completing the form.

It is important to give all requested information on the form so that the appropriate tests and procedures are offered to the participants. For example, if you work in a room that houses two or more species, you will be exposed to all species. Mail, FAX or hand-deliver the completed form to EH&S within one week of the individual's initial association with animal(s). Please note, whenever a participant uses a different species, a new animal contact form must be completed and sent to EH&S.

As an animal user, you are highly encouraged to participate in the medical monitoring program and to take advantage of this medical screening. In addition, if you are a graduate student or a researcher employed by the University, this medical screening is provided to you at no cost.

Note: Individual colleges and departments will cover all cost related to the medical evaluations and surveillance for their employees. The clinic will submit all bills to EH&S. Colleges and departments will then be “billed-back” by EH&S for actual costs.

Medical Screening

As indicated above, individuals working with animals must obtain a "Medical Monitoring Authorization Packet" and submit it to EH&S. The packet includes:

- The Risk Assessment for Animal Contact “Health Statement” and “Health Questionnaire” forms
- A Waiver of Medical Screening form

The EH&S Coordinator will review the information and make an assessment. If medical screening is recommended, the coordinator will contact the animal user to discuss his/her findings and provide a Medical Surveillance, Referral and Approval (MSRA) form. The individual working with animals should make an appointment with the MSP listed on the MSRA form, and present the form at the scheduled visit. This will permit the MSP to verify enrollment in the program and provide the required medical screening.

*If an individual does not want to receive recommended medical screening, he/she should complete the Waiver of Medical Screening form and follow the Waiver of Medical Procedures process below.
Follow-up Medical Screenings

Certain medical screenings will be repeated on a periodic basis. For example, the TB screening could be done annually if deemed necessary, and a rabies titer may be taken every two years, depending upon the recommendation from the MSP. When an animal user is scheduled for such screenings, a "Medical Surveillance, Referral and Approval" form will be sent to the person to review. The individual should make an appointment with the MSP listed on the MSRA form and then report to the MSP and present the form to verify enrollment in the program to receive the required medical screening.

Records

The MSP will maintain permanent medical records for each animal user. An individual may request a copy of their medical information by completing the necessary forms.

Waiver of Medical Procedures

The individual working with animals can choose to waive the medical screening. The individual may selectively waive a particular medical procedure listed on "Waiver of Medical Screening" form found in the "Medical Monitoring Authorization Packet." The form(s) should be completed, and signed by the animal user, and returned to EH&S for processing.

Whether the individual working with animals chooses to waive the medical screening entirely or selectively, an animal user can later decide to participate in those medical services; the animal user may do so at any time. The animal user should notify EH&S immediately and the appropriate forms will be issued.

Termination of a Participant

The Principal Investigator, supervisor, or the designated contact person for MMPAU must notify EH&S whenever an individual working with vertebrate animals is about to terminate his or her association with the Principal Investigator, supervisor, or ceases vertebrate animal contact.

Accident and Illness Related to Animal Users

Individuals should promptly report any illnesses, bite or scratch wounds that might result from animal contact to the Principal Investigator, supervisor, or designated contact person for MMPAU. The PI, supervisor, or designated contact person for MMPAU would then inform Workers' Compensation Office of this information. Medical services would then be provided as determined by the MSP.

Contact Workers' Compensation Office at 297-3077 or on the web at http://personnel.fau.edu/EmpDevelopment/WorkersComp.htm for procedures on reporting illnesses, bite or scratch and wounds that might result from animal contact.
Health History Questionnaire

All individuals working with vertebrate animals who choose to participate in MMPAU will be asked to complete a "Risk Assessment for Animal Contact: Health Questionnaire" to facilitate the MSP evaluation of the participant. The information generated will help to identify existing conditions that may influence the health of persons with animal contact. If necessary, additional supplemental health history forms may be used in conjunction with the MSP questionnaire.

In addition to the medical questionnaire, an individual's medical history may be requested as well as questions about the following:

Allergies

Animal care staff and others who handle animals may be sensitized to animal dander or other proteins. Individuals at risk of developing allergies or experiencing the onset of existing allergic reactions include those with preexisting allergies, asthma, seasonal rhinitis or eczema. Individuals with preexisting allergies are encouraged to seek help from a private physician. Individuals with work-related allergies are encouraged to seek advice from the MSP. Preventing exposure to the allergies may require the use of personal protective equipment such as gowns, gloves, and respiratory protection.

Allergic reactions to animals are among the most common conditions that adversely affect the health of workers involved in the care and use of animals in research. Of the 90,000 laboratory animal workers in the United States, up to 46% develop allergies to laboratory animals. Of those who develop symptoms, more than 10% eventually develop occupational related asthma with symptoms that persist even after exposure ceases. The manifestations of animal allergies, which range from rhinitis and itchy eyes to respiratory distress, have caused more than one third of laboratory animal workers at the National Institutes of Health to lose time from work.

Animal users are highly encouraged to review the information relating to animal allergies located at: ILAR Journal Online, Volume 42(1) 2001 Laboratory Animal Allergy

Pregnancy Status and Toxoplasmosis Screening

Toxoplasmosis is a widespread disease of animals and man. In both, the disease is usually asymptomatic and of no serious consequence. However, the fetus of a pregnant woman is at great risk. Infection during pregnancy may result in miscarriage, stillbirth, or severe disease in newborns. It is thought that an important mode of transmission is by human exposure to oocysts (a form of the infectious agent) in cat feces. There is no practical, simple test to determine which cats may be shedding the organism. As a result, the participant should consider exposure to any cat a potential threat to the pregnant woman. Pregnant researchers are advised to speak to their Principal Investigators or supervisors about working with cats during their pregnancies. All persons, regardless of sex, who normally work with cats, will be scheduled to have their blood checked for antibodies against the disease.
Impairment of the Immune System

The risk of contracting a disease from animals is minimal. However, individuals with an impaired immune system, due to medication or disease, may be at significantly greater risk. It is important that the MSP be apprised of factors such as this that could adversely influence human health.

Medical Vaccinations, Screening and Examinations

In order to ensure animal users' health and safety, the following medical vaccinations, screening and/or examinations may be offered.

Tetanus Vaccination

A tetanus vaccination will be administered to all vertebrate animal users at ten-year intervals. Tetanus is normally associated with wounds contaminated with dirt or the feces of some animals. All bite wounds carry the risk of tetanus and should be reported to EH&S (refer to Accident and Illness Related to Animal User). If a contaminated wound occurs (including all animal bites or cuts and/or scratches in contact with dirty surfaces) and it has been five or more years since vaccination, a booster may be administered at the time the person is seen for evaluation.

Physical Examination

Individuals who have daily contact with any species located at the University will be offered a physical examination at the time of initial animal association. The physical examination is performed by the MSP. The examination includes obtaining a medical history; examination of the patient; laboratory tests which may be comprised of a dip urinalysis, complete blood count and multi-chemistry blood panel; and evaluation of test and exam results. Note that it is recommended that no eating or drinking occur within a twelve hour period before the examination for the purpose of an accurate analysis of the complete blood count. A physical examination needs to be performed only once unless the Medical Services Provider determines it should be done periodically.

Tuberculin Skin Test

Individuals who have contact with non-human primates may receive a tuberculin skin test and/or a chest x-ray as clinically indicated. Testing is done with the Mantoux (PPD) technique that measures hypersensitivity to tuberculin. The appearance of inflammation at the site of injection is measured to indicate past or present tuberculosis infection.

Rabies Vaccination

Individuals who have contact with any species that might be exposed to rabies or who work in wilderness areas will be offered the rabies vaccination. This is a pre-exposure vaccination consists of a series of three injections given on days 0, 7, and 28. Every two years a rabies titer may be drawn to check for immunity against rabies. A rabies booster will be administered if necessary.
Hepatitis B Virus Screening

Individuals, who have occupational exposure to human or simian blood, tissue or other potentially infectious materials while working on animal research, will be offered the Hepatitis B vaccination.

Q-Fever

Q-fever is a zoonosis caused by the rickettsia Coxiella burnetti. Dogs, cats, and domestic ungulates such as pigs, sheep, cattle and goats usually serve as the reservoir of infection for humans and shed the organism in their urine, feces, and milk. Humans acquire the infection by inhaling infectious aerosols and dusts. A single inhaled organism can cause infection. The clinical features of Q-fever are diverse and may vary from subclinical infection to pneumonia, hepatitis or endocarditis.

Preventive Measures

In order to ensure animal users maintain their highest level of health and safety, the following preventive measures are highly encouraged. See also Health and Safety SOPs for Animal Use and Health and Safety Training for Animal Use

Personal Hygiene

There are a number of personal hygiene issues that apply to all workers who are exposed to animals. There should be no eating, drinking, or applying of cosmetics in areas where animals are housed. All work surfaces should be decontaminated daily and after any animal-related spills or contacts. Laboratory coats should be worn over street clothes or employees can change into special designated clothing when working with animals. Personal protection should be used appropriately. Most importantly, thorough hand washing must be done after handling the animals and prior to leaving the laboratory.

Education and Training

Initial training will be provided to all individuals who will use or be exposed to animals. Follow-up training will be provided as needed. For training click on the following link: Health and Safety Training for Animal Use. Instruction will include precautionary procedures available to prevent accidents or contraction of any illness, the proper handling of animals and an overview of the administrative procedures for the MMPAU. EH&S will provide training on all other health and safety topics.

Personal Protective Equipment (PPE)

Appropriate PPE should be provided at no cost to the individuals with animal contact. Appropriate PPE includes gloves, face shields or masks, eye protection, scrubs, gowns, aprons, laboratory coats, or any other appropriate PPE. The department, laboratory, Principal Investigator, or supervisor is also
responsible for cleaning, laundering, disposal and replacement of PPE at no cost to the individual with vertebrate animal contact.

PPE should be used accordingly whenever animals are handled, transported, or restrained, cages are cleaned, or whenever animal contact could occur. For more information on the proper use of PPE, consult the Occupational Health and Safety in the Care and Use of Research Animals guide and the Guide for the Care and Use of Laboratory Animals, published by the National Research Council. Both of these guides are available online at: http://www.nap.edu/books/0309052998/html and http://search.nap.edu/html/labrats.

Failure to use appropriate PPE may increase the chance of being exposed to potentially hazardous materials from animal contact, so the use of proper PPE is highly encouraged and recommended.

Waiver of Medical Screening

FLORIDA ATLANTIC UNIVERSITY

Medical Monitoring Program for Animal Users

INSTRUCTIONS: Employees working with animals must use this form to decline the medical screening procedures offered by the university to protect their health.

I understand that due to my occupational exposure to animals or other potentially infectious materials I may be at risk of contracting certain Zoonotic diseases. I have been given the opportunity to receive certain medical procedures and/or to be vaccinated with the vaccines listed below, at no charge to myself. However, I decline the procedures checked-off below at this time. I understand that by declining these vaccines/procedures, I continue to be at risk of acquiring the associated serious diseases. If in the future I continue to have occupational exposure to animals or other potentially infectious materials and I want to be vaccinated/screened with the following vaccines/procedure, I can be treated at no charge to me.

☐ Tetanus immunization
☐ Rabies immunization
☐ Toxoplasmosis Titer
