Memorandum

To: University Graduate Program Committee
From: Kathleen Guthrie, PhD, Assistant Director, Graduate Neuroscience Training Program
Subject: New course
Date: November 29, 2018

This memo requests approval to create a new graduate course entitled “**GNTP PhD Lab Rotation**” (PCB 6977, 1-2 credits, S/U/I). This is needed as currently there are no doctoral level research rotation courses of this type in Complex Systems and Brain Sciences (CSBS), or Experimental Psychology, two of the programs participating in the FAU Brain Institute’s Graduate Neuroscience Training Program (GNTP). The third participating program, Integrative Biology and Neuroscience (IBN), already has a research rotation course in place for their direct admit PhD students (BSC 6977, Integrative Biology Laboratory Rotation, formerly under BSC 6905). PhD students accepted through the GNTP and admitted to their PhD program of interest (IBN, CSBS or Exp Psych) are required to take a common curriculum in their first year. During this time, they will engage in 2-3 research rotations (8-12 wks each) to explore their areas of interest and gain training and experience in different techniques, experimental models, and areas of research in neuroscience. A minimum of two rotations is required, with three recommended. Rotation research credit under the PCB code will apply toward the PhD degrees in all three programs.

Rotations are arranged by mutual agreement between the students and supervising faculty members and can be done in any of the laboratories across the three PhD programs. Required research work and criteria for evaluations (S/U/I) will be agreed upon by the supervising mentor and the student at the start of each rotation. The Assistant Director of Education for the Brain Institute will serve as the instructor of record for registration and grade submission purposes, with the latter based on written faculty evaluations of the students. By the end of the first spring semester, by agreement with a prospective mentor, students will identify the laboratory in which they will pursue their dissertation work. They will then follow the curriculum requirements for the program in which the mentor holds their major academic appointment.

This rotation structure is common to most multidisciplinary Neuroscience PhD programs in the US and has been widely adopted to provide students with breadth in early research experiences, and flexibility in making informed choices when selecting dissertation projects and PhD supervisors. Often it also leads to collaborative research work initiated by students developing projects that overlap the research areas of their rotation laboratories.
